

# Ext JS Overview

Loiane Groner - loianeg@br.ibm.com

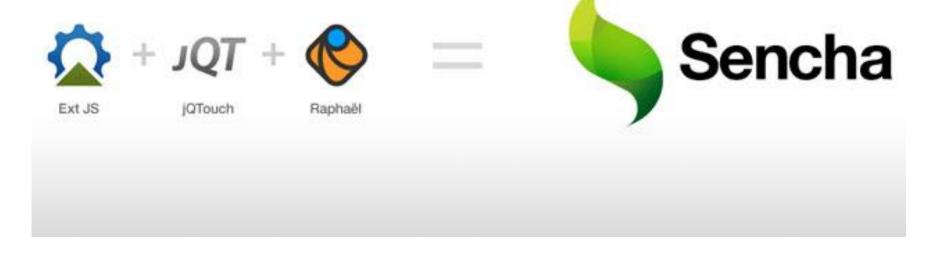

#### **About me**

- 5+ years of web development experience
- Java/ExtJS Team Leader IT Specialist at IBM Brazil
   International project US client
- Java/JEE/XML/ExtJS Technical Leader at IBM
- IBM Academic Initiative Ambassador
- JUG Leader at CampinasJUG/Java Campinas (Brazilian JUG – Java User Group)
- JUG Coordinator at ESJUG (Brazilian JUG)

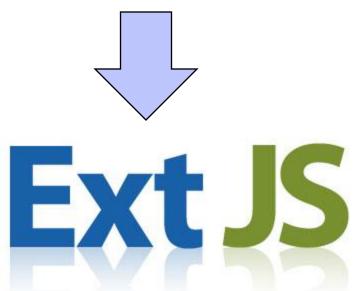

#### YUI Lacked:

- Easy to use API
- Real World Widgets

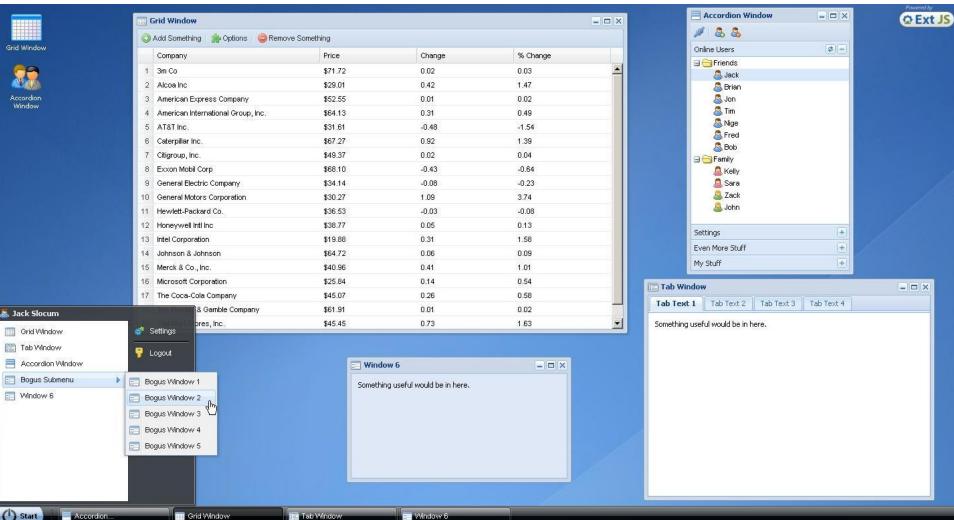

## Why Ext JS?

## Windows looks like OS windows – support dragging/resizing/closing

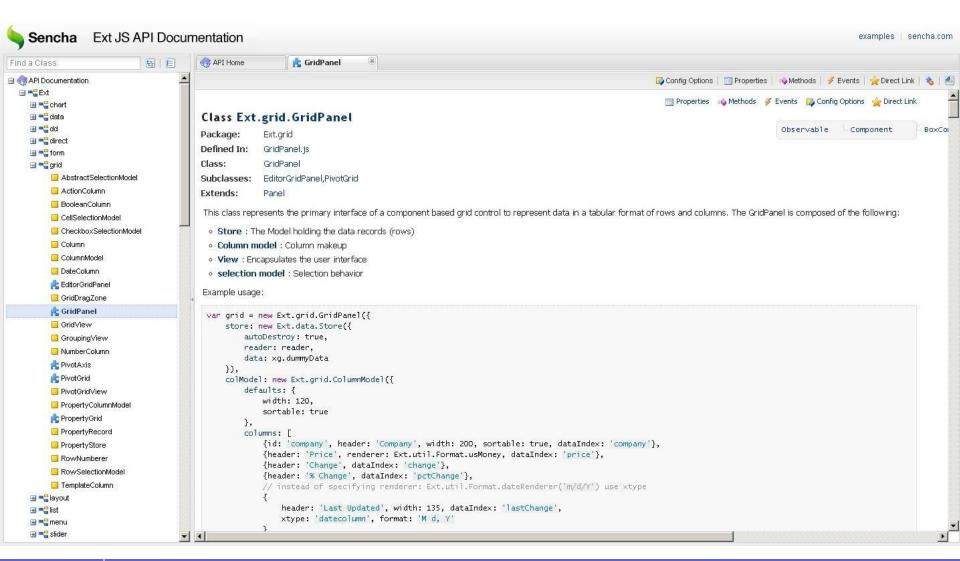

#### **Good Documentation**

### **Community Support**

#### Sencha Forum

#### **Adapters**

## Widgets

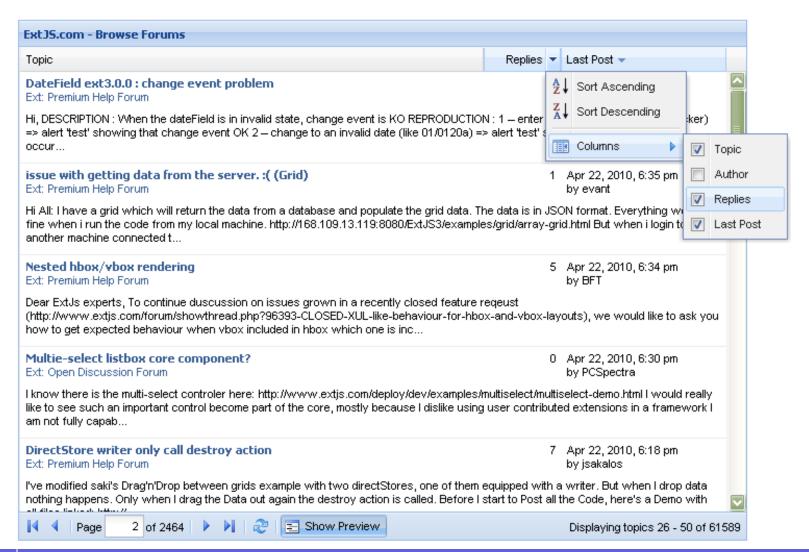

#### **Data Grid**

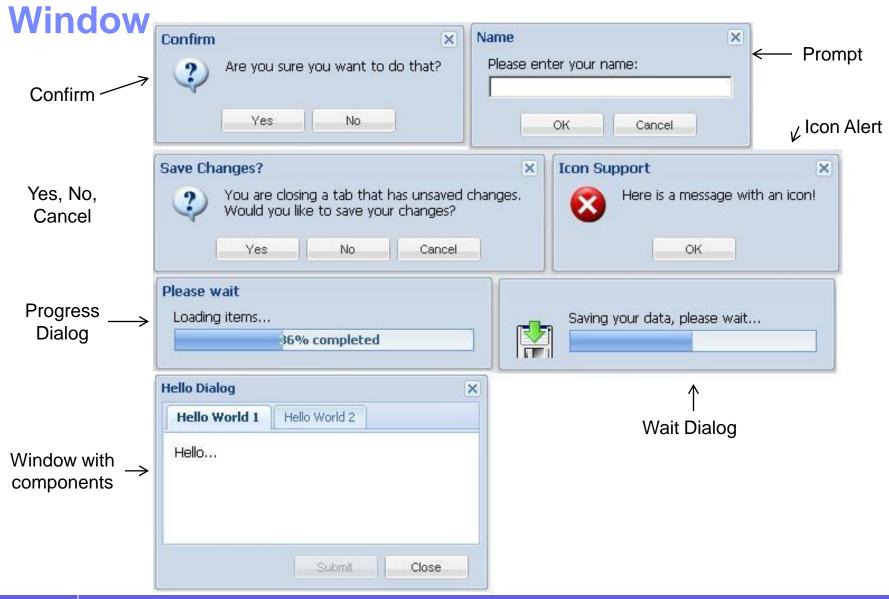

## support paging/filtration/sorting/grouping/editor/RESTful Easy to load/save data to server in different formats – xml/json

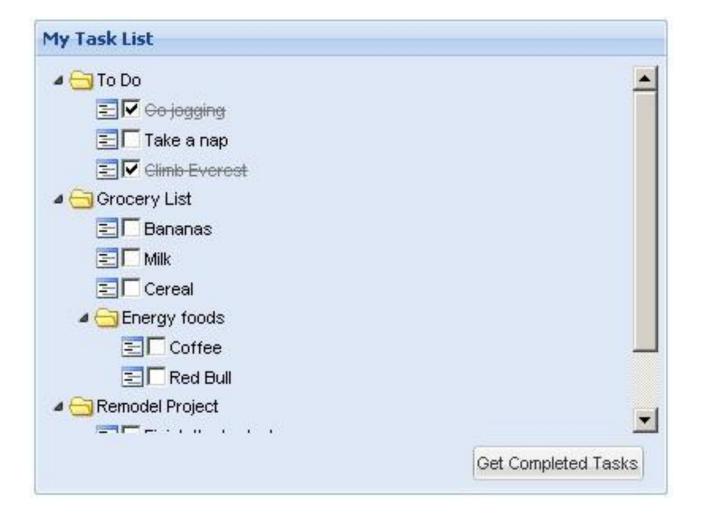

#### **Tree Panel**

support drag and drop/multiple trees/reordering/checkbox Easy to load/save data to server in different formats – xml/json

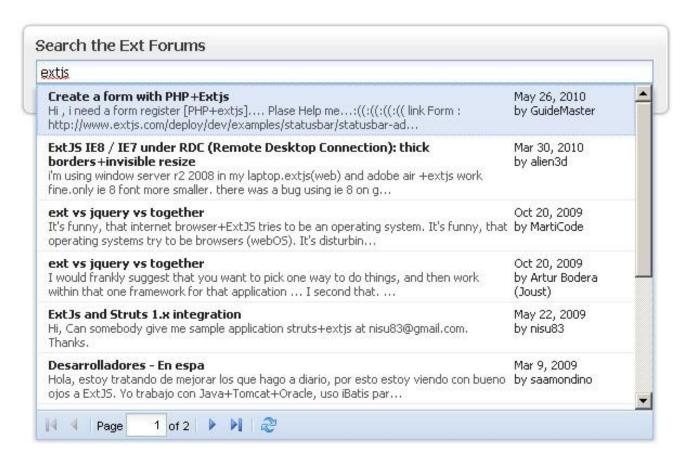

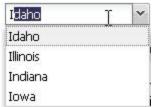

#### **Combo Boxes**

support autocomplete/typing/ajax/search/adavanced template Easy to load/save data to server in different formats – xml/json

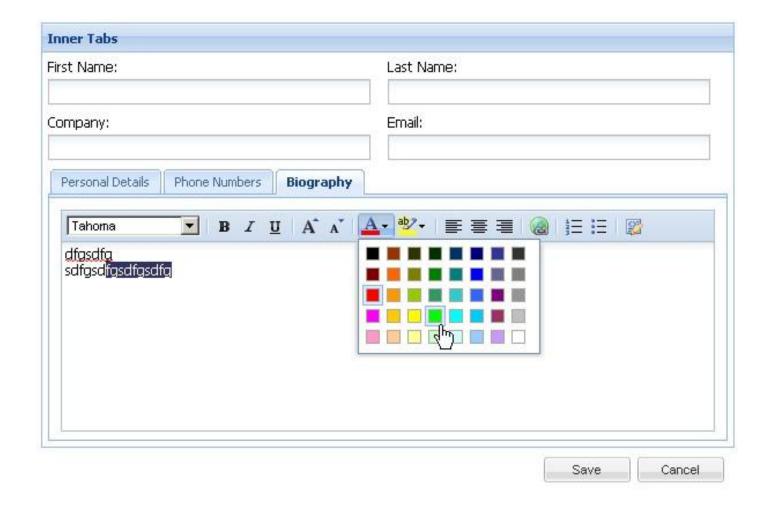

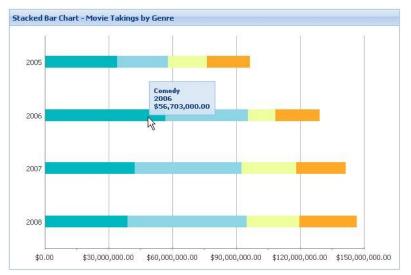

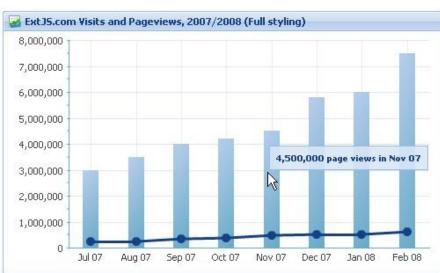

#### **Forms**

## support ajax/file upload, calendar, etc Easy to load/save data to server in different formats – xml/json

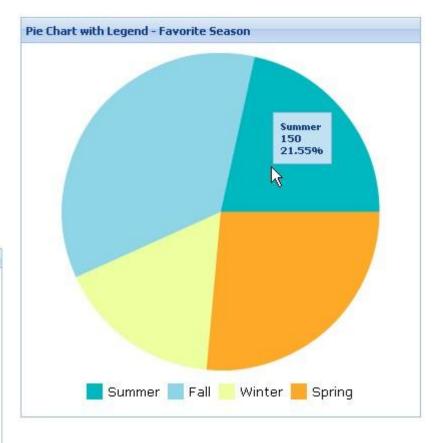

#### Charts

#### Dynamic – supports reloading on run time Requires Flash

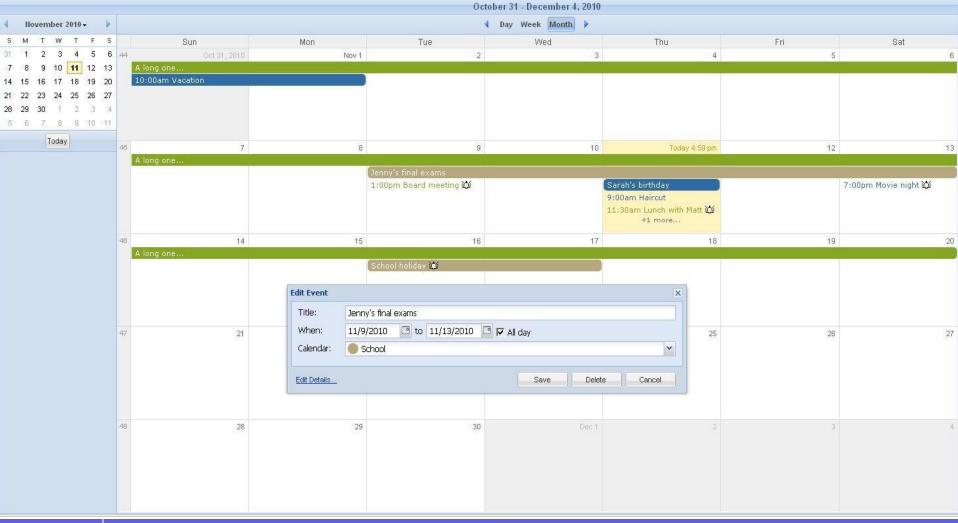

#### Calendar

#### Google Calendar – same functions Ext JS 3.3+

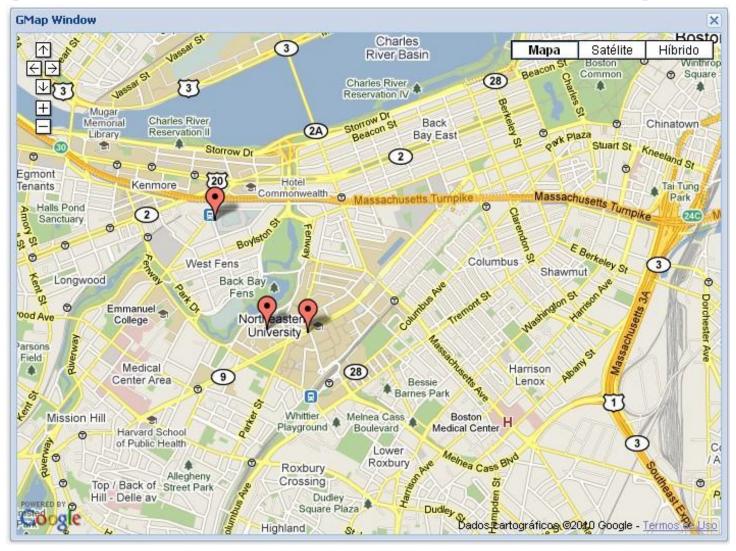

11 Ext JS Calendar

#### Google Maps, Gears and Adobe Air Integration

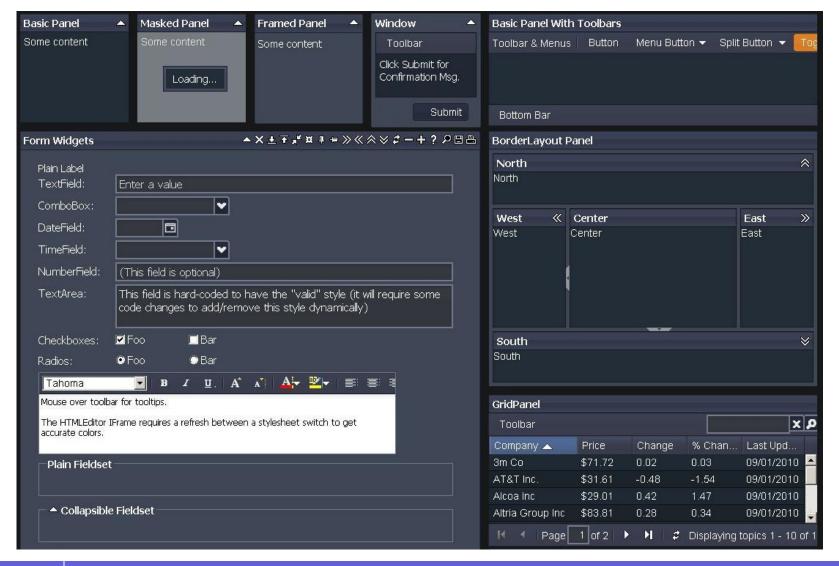

#### **Themes**

#### Easy to customize

#### What Else Ext JS Can Do?

- Ajax support
- Dom traversing
- Dom manipulation
- Event Handling
- Selectors
- OOP emulation
- Animation

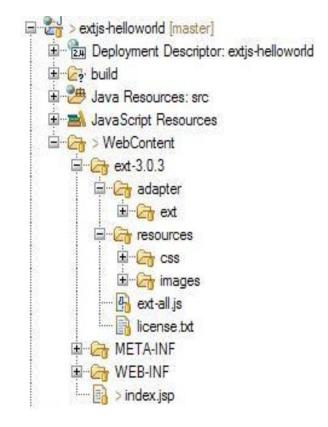

#### Hello World using Eclipse IDE – Java project

- Donwload:
  - http://sencha.com/products/extjs/download.php
- Create a Dynamic Web Project.
- Under WebContent folder, create a folder where all ExtJS files will be located (I named it ext-3.0.3). Paste adapter and resources folders under your extjs folder. Also, paste this file: extall.js under ext-3.0.3:

```
<head>
    <!- + Ext relies on its default css so include it here. -->
    <!-- This must come BEFORE javascript includes! -->
    k rel="stylesheet" type="text/css" href="/extjs-helloworld/ext-3.0.3/resources/css/ext-
all.css" />
    <!-- Include here your own css files if you have them. -->
    <!-- First of javascript includes must be an adapter... -->
    <script src="/extjs-helloworld/ext-3.0.3/adapter/ext/ext-base.js"></script>
    <!-- ...then you need the Ext itself, either debug or production version. -->
    <script src="/extjs-helloworld/ext-3.0.3/ext-all.js"></script>
    <!-- Include here your extended classes if you have some. -->
    <!-- Include here you application javascript file if you have it. -->
    <title>Getting Started with Extjs</title>
    <!-- You can have onReady function here or in your application file. -->
    <!-- If you have it in your application file delete the whole -->
    <!-- following script tag as we must have only one onReady. -->
    <script type="text/javascript">
    // Path to the blank image must point to a valid location on your server
    Ext.BLANK IMAGE URL = '/extjs-helloworld/ext-3.0.3/resources/images/default/s.gif';
    </script>
</head>
<body>
</body>
</html>
```

<html>

#### **Hello World**

```
<script type="text/javascript">

// Path to the blank image must point to a valid location on your server
    Ext.BLANK_IMAGE_URL = '/extjs-helloworld/ext-
3.0.3/resources/images/default/s.gif';

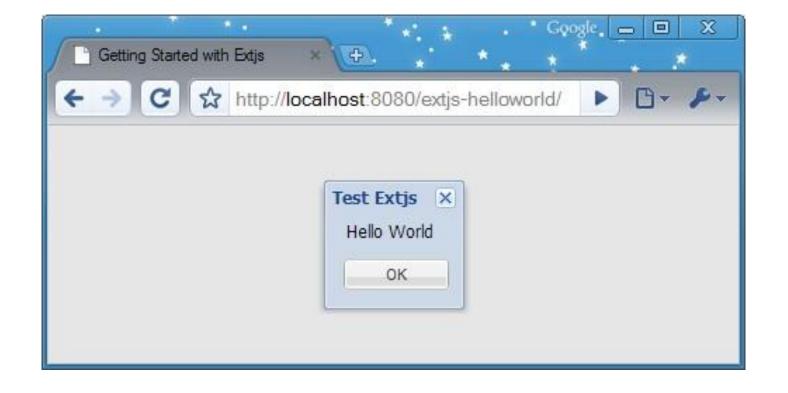

Ext.onReady(function(){
    Ext.Msg.alert('Test Extjs', 'Hello World');
});

</script>
```

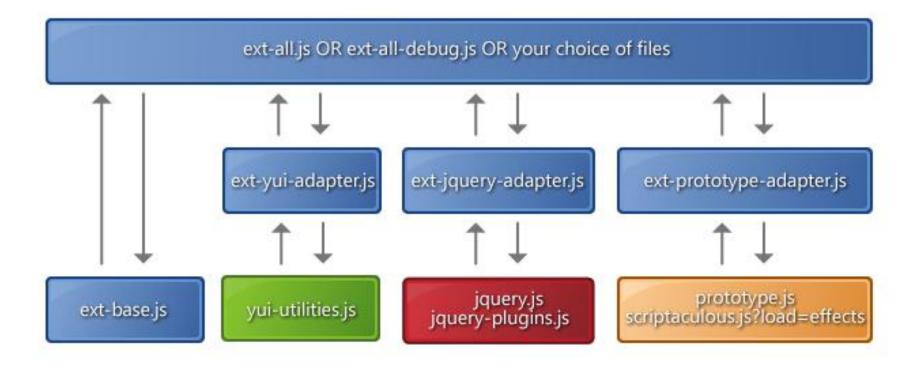

#### **Ext JS and Base Library Relations**

#### **Main Ext JS Classes**

- Component
- Panel
- Container
- Store

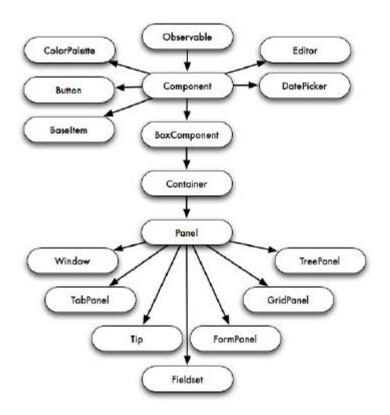

### \*

### Component

- All widgets extends component class
- Provide base widget functions like
  - enable()/disable()
  - show()/hide()
  - addClass()/removeClass()
  - update(data/html) update content area
  - getEl() return element
  - getId()
  - getXType()
  - render(target)
  - focus()
- XType alternate way to define component
  - Lazy component creation
    - var panel1 = {
    - xtype : 'panel',
    - title: 'Plain Panel',
    - html : 'Panel with an xtype specified'
    - }
    - var myPanel = new Ext.Panel({
    - renderTo : document.body,
    - height: 50,
    - width: 150,
    - title : 'Panel',
    - frame : true

- Components are managed by Ext.ComponentMgr
  - get(componentId)
  - registerType(xtype, object) (shorthand Ext.reg())

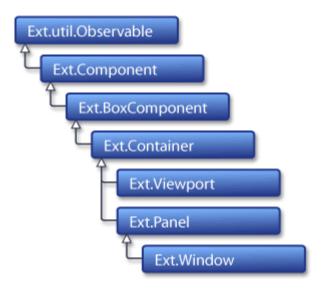

#### **Containers**

- handle the basic behavior of containing items, namely adding, inserting and removing items
- Main functions
  - add()
  - remove()/removeAll()
  - insert()
  - find()/findBy()/findById()/findByTy pe
  - doLayout()
  - get(index or id)/getComponent(component or

index or id)

- Main prop
  - Items MixedCollection of children components

## **Panels**

- Main panel functions/prop/conf prop Pa
  - load()
    - panel.load({
    - url: 'your-url.php',
    - params: {param1: 'foo', param2: 'bar'}, // or a URL encoded string
    - callback: yourFunction,
    - scope: yourObject, // optional scope for the callback
    - discardUrl: false,
    - nocache: false,
    - text: 'Loading...',
    - timeout: 30,
    - scripts: false
    - **)**);
  - body prop
  - html conf prop
  - autoLoad conf prop
- Toolbar and Bottombar

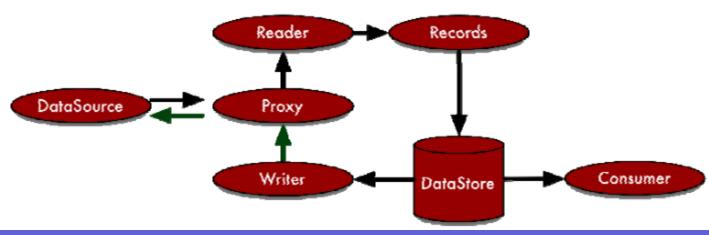

- Panel subclasses
- TabPanel
- Window
- FormPanel
- GridPanel
- TreePanel

#### **Stores**

- Data storage/Loading
- Store contains records object which contain a server data directly
  - Store is able to insert/update/add records
- SubClasses
  - ArrayStore: Store + ArrayReader plain js array can be loaded into the array store
  - DirectStore: Store + DirectProxy + JsonReader CRUD operation is going thought custom js method
  - GroupingStore: store for grid rows grouping
  - JsonStore: Store + JsonReader
  - XmlStore: Store + XmlReader

#### **Stores**

- Main exchange format: XML and JSON
- Easy to integrate any language/framework with XML or JSON support:

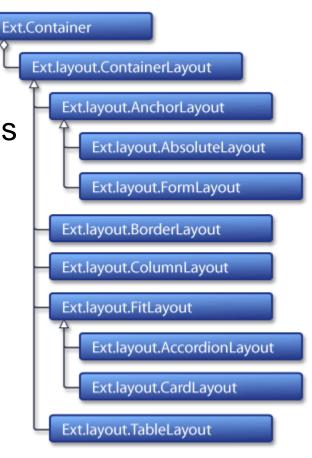

## **Layout Manager**

- Layouts manages by containers there is no need to create Layouts directly
- The most useful are Fit, VBox, HBox, Border
  - Only VBox, HBox, Border layouts supports margins
- Flex prop of VBox, HBox
- BorderLayout must have center item
- Table layout does not support resizing of items

# Demo: CRUD Grid + Spring + Hibernate

http://github.com/loiane/extjs-crud-grid-spring-hibernate

## Testing -Selenium

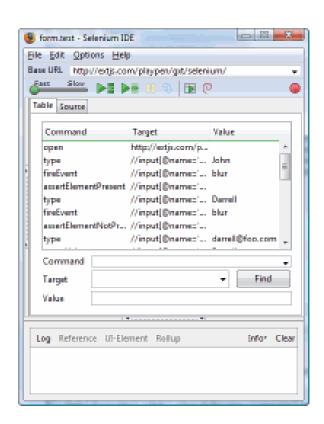

### Selenium IDE

- Firefox Extension
- List of Commands
- Selenium Locators Xpath Expressions
- Example expressions look like this:
- //input[@name='name']
- //input[@name='name' and contains(@class, 'x-form-invalid')]
- //input[@name='company']/following-sibling::img
- //div[@id='Apple']
- //div[@class='x-combo-list-item'][3]
- Examples using CSS selectors:
- css=html:root
- css=div#structuralPseudo :nth-last-child(2)
- css=a[class~="class2"]

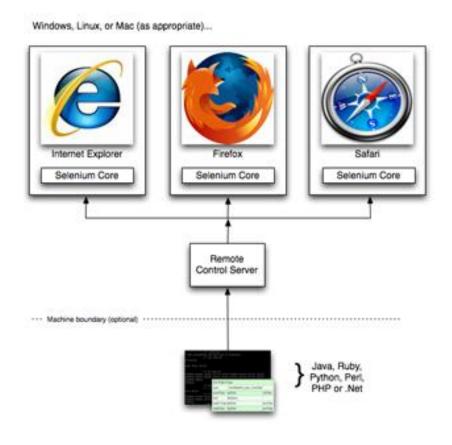

## **Executing Tests with Selenium Remote Control (RC)**

- **Programming Language**
- HTTP Proxy

#### **Java Test**

```
public class SeleniumTestCase extends SeleneseTestCase {
  private Selenium selenium;
  public void setUp() {
    selenium = new DefaultSelenium("localhost", 4444, "*iexplore", "http://extjs.com");
    selenium.start();
  public void testForm() {
     selenium.open("http://extjs.com/playpen/gxt/selenium/");
     pause(500);
     selenium.type("//input[@name='name']", "John");
    selenium.fireEvent("//input[@name='name']", "blur");
    assertTrue(selenium.isElementPresent("//input[@name='name' and contains(@class, 'x-form-invalid')]"));
selenium.type("//input[@name='name']", "Darrel]");
    selenium.fireEvent("//input[@name='name']", "blur");
assertFalse(selenium.isElementPresent("//input[@name='name' and contains(@class, 'x-form-invalid')]"));
selenium.type("//input[@name='email']", "darrell@foo.com");
assertEquals("Darrell", selenium.getValue("//input[@name='name']"));
    assertTrue(selenium.getValue("//input[@name='birthday']").matches("^[\\s\\S]*$"));
    selenium.check("//input[@value='Classical']");
assertEquals("on", selenium.getValue("//input[@value='Classical']"));
selenium.check("//input[@value='Blue']");
     assertEquals("on", selenium.getValue("//input[@value='Blue']"));
  public void tearDown() {
    selenium.stop();
}
```

## **Important!**

 Selenium tests for ExtJS should rely on CSS selectors. For every button, grid, label, tab or any significant UI element, simply chose to use the <u>cls</u> attribute and specify a CSS class.

```
new Ext.Button({
    text: 'Send',
    cls: 'seleniumSendBtn', //classes separated by space
    scope: this,
    handler: function() { ... }
})
```

This is how a basic button that is used in automation testing looks like:

```
//table[contains(@class,'seleniumSendBtn')]
```

- Complex UI
- Features

## **DO NOT Use Ext JS**

- Simple UI
- Single Component
